

# Object-Oriented Programming in C++ (SS 2022)

## Exercise 6: June 23, 2022

Wolfgang Schreiner  
Research Institute for Symbolic Computation (RISC)  
Wolfgang.Schreiner@risc.jku.at

May 31, 2022

The exercise is to be submitted by the denoted deadline via the submission interface of the Moodle course as a single file in zip (.zip) or tarred gzip (.tgz) format which contains the following files:

- A PDF file `ExerciseNumber-MatNr.pdf` (where *Number* is the number of the exercise and *MatNr* is your “Matrikelnummer”) which consists of the following parts:
  1. A decent cover page with the title of the course, the number of the exercise, and the author of the solution (identified by name, Matrikelnummer and email address).
  2. For every source file, a listing in a *fixed width font*, e.g. `Courier`, (such that indentations are appropriately preserved) and an appropriate *font size* such that source code lines do not break.
  3. A description of all tests performed (copies of program inputs and program outputs) explicitly highlighting, if some test produces an unexpected result.
  4. Any additional explanation you would like to give. In particular, if your solution has unwanted problems or bugs, please document these explicitly (you will get more credit for such solutions).
- Each source file of your solution (no object files or executables).

Please obey the coding style recommendations posted on the course site.

## Exercise 6: Polygons by Containers

The goal of this exercise is to generalize the classes developed in Exercise 3 where coordinates were represented by double values to class templates that take a type parameter  $C$  that represents the type of the coordinates:

```
template<typename C> class Point ... ;
template<typename C> class Polygon ... ;
template<typename C> class RegularPolygon ... ;
template<typename C> class Square ... ;
template<typename C> class Hexagon ... ;
template<typename C> class Picture ... ;
```

Here  $C$  is assumed to be a numeric type with the usual arithmetic operations.

The internal representation of these objects shall be based on containers of the standard library; in particular, use types

```
list<Point<C> > points in polygon are ordered
unordered_set<Polygon<C>*> assume the polygons to be unordered in picture
```

for the sequence of points in `Polygon<C>` and for the set of polygon pointers in `Picture<C>`, respectively (`unordered_set` is a variant of `set` that does not demand any ordering from its base type). Both kinds of collections are to be traversed by the corresponding iterators.

Test these classes as in Exercise 3 by creating a picture of polygons; instantiate type parameter  $C$  with argument `double`.

original code from the Polygon project remains the same (virtual needs to be kept) because there is still inheritance the change here is from the points beeing double to having the type C.
